Mile-a-minute Vine (MAM)

(*Persicaria perfoliata*, formerly *Polygonum perfoliatum*)

Mile-a-minute Vine is a highly invasive annual weed spreading north and east across Connecticut, Massachusetts, New York and Rhode Island. It outcompetes and overgrows native species, causing ecological and economic harm. It climbs and scrambles over trees and posts, shading out other plants (see photo at left). A single vine can grow up to 6 inches per day.

Please help us find, track and control this invasive plant.

THREE IDENTIFYING TRAITS:

1
Triangular leaves
(often nearly equilateral)

2
Small curved barbs
along stems

3
Saucer-shaped leaves (called ocrea) at stem nodes

In summer, MAM fruits ripen from green to metallic blue

Leaf shapes of other vines; these species do not harm ecosystems and should **not** be reported:

If you observe a plant with all three traits, note its location and report your findings:
